Choroidal neovascularization (CNV) is a leading cause of blindness worldwide. It is a condition in which new blood vessels grow from the choroid, the layer of tissue beneath the retina. These new blood vessels can leak fluid and blood, which can damage the retina and lead to vision loss.

CNV can be caused by a variety of factors, including:

- Age-related macular degeneration (AMD)
- Diabetic retinopathy
- Myopia
- Ocular trauma
- Inflammation

The symptoms of CNV can vary depending on the location and severity of the condition. Some common symptoms include:

- Blurred vision
- Distorted vision
- Dark spots or lines in the vision
- Loss of central vision

CNV is diagnosed with a variety of tests, including:

- Fundus examination
- Fluorescein angiography
- Indocyanine green angiography
- Optical coherence tomography (OCT)

The treatment for CNV depends on the underlying cause and the severity of the condition. Some common treatments include:

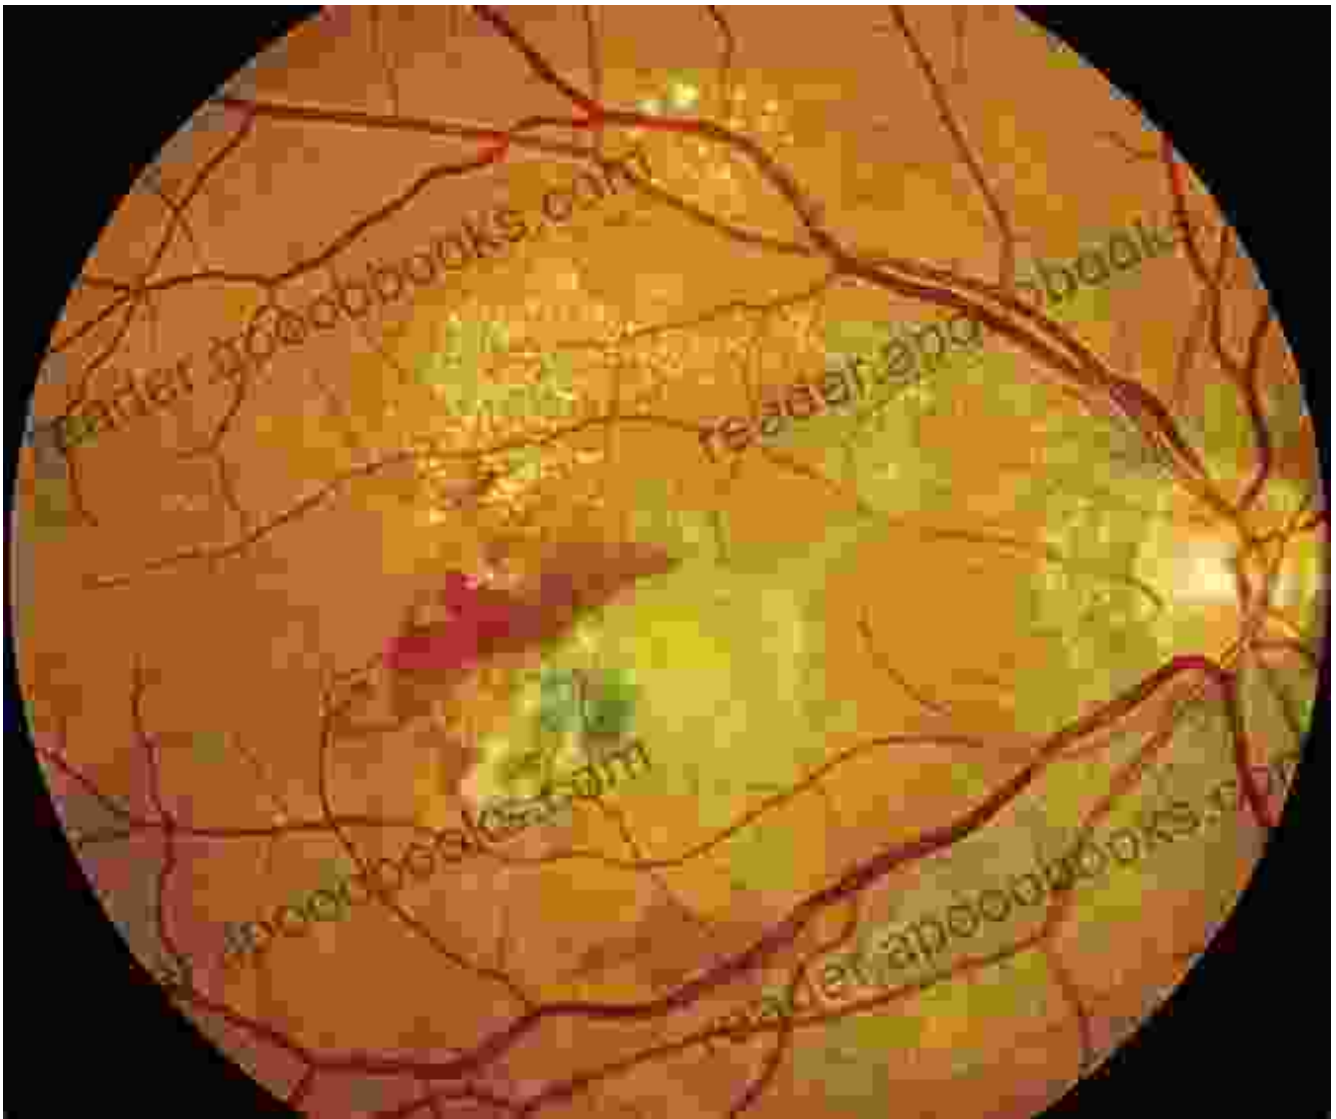

- Anti-VEGF injections
- Laser therapy
- Photodynamic therapy
- Surgery

CNV is a serious condition that can lead to vision loss. However, with early diagnosis and treatment, most people with CNV can maintain their vision.

## Free Download Your Copy Today!

This comprehensive book provides a detailed overview of CNV, including its epidemiology, pathogenesis, clinical presentation, and management. It is an essential resource for clinicians who treat patients with CNV.

To Free Download your copy, please visit our website or contact your local bookstore.

## About the Author

Kelly Harms, MD, is a board-certified ophthalmologist and vitreoretinal surgeon. She is the director of the Retina Service at the University of California, San Francisco. Dr. Harms is a leading expert on CNV and has published numerous articles and book chapters on the condition.
