Surgical excision of endometrial implants is the mainstay of treatment for DEPE. The goal of surgery is to remove as much of the endometrial tissue as possible while preserving the function of the surrounding organs. The type of surgical approach used will depend on the location and extent of the endometrial implants.

In addition to surgical treatment, holistic care approaches can help women manage the symptoms of DEPE and improve their overall well-being.

These approaches may include:

- **Pain management:** Medications, acupuncture, and physical therapy can help reduce pain.
- **Pelvic floor exercises:** Strengthen the muscles that support the pelvic organs and reduce pain.
